RUNNING THE PRODUCT

Extract **schema-eval.zip** to find a folder "schema-eval".

①

Run **doit.bat** to install the product, and then **runit.bat <filename>** to generate the artifacts (SQL script, schema visualization, DTD and XML schema).

③

Optionally, you can control what products are produced by using arguments (see next page).

Open **command prompt** & change directory into the folder

②

You should be over the moon! The heuristics have been created. Too easy!

④

View the **SQL script, DTD and XML Schema** in a text editor, and the **schema visualization** HTML page ("index.htm") using your favourite browser.
